

Corporate Security Standards

XOR Data Exchange was built from the ground up using *Privacy by Design* standards. That means the security of data we collect and analyze is our first priority throughout every stage of our business, from ideas to execution. When possible, XOR purges data following completion of its use.

Additionally, XOR's security standards go above and beyond industry standards and best practices. The measures we take to protect data include:

Enterprise-Wide Data Protection Technologies

Our technologies are encrypted from beginning to end with the best available security standards.

Firewall & Intrusion Detection Systems

We've built secure walls around everything we do, and they're monitored 24/7/365 by a security analyst.

Antivirus and Endpoint Protection

Protection against viruses intended to infect our systems and steal information.

24/7 System Monitoring for Behavioral Anomalies

If something suspicious occurs, we know about it immediately.

Monthly Employee Security Training

Every XOR employee knows how valuable your data is and does his or her part to protect it.

Physical Security Controls

Our buildings and data centers are protected to keep hardware safe.

Quarterly & Annual Security Audits

We continually seek out opportunities to make our systems more secure.

For questions regarding XOR's security practices or the safety of your data, email info@xor.exchange.
